

In this module, we will take the next step up in the stack. We will use combinational logic circuits to build more complicated circuits, specifically decoders and multiplexers (often shortened to [singular] “mux” and [plural] “muxes”), and learn how to build any function that is described by a truth table.

At the end of this module, you will be able to:

- Complete truth tables for given decoders and muxes.
- Build decoders and muxes.
- Be able to implement any truth table using logic gates.

INTRODUCING MUXES AND DECODERS

EdX offers interactive online classes and MOOCs from the world's best universities. Online courses from MITx, HarvardX, BerkeleyX, UTx and many other universities. Topics include biology, business, chemistry, computer science, economics, finance, electronics, engineering, food and nutrition, history, humanities, law, literature, math, medicine, music, philosophy, physics, science, statistics and more. EdX is a non-profit online initiative created by founding partners Harvard and MIT.
